

MalwareReportAI – Synthetic Infostealer Test Report

Purpose: This is a synthetic cybersecurity test document created to validate the MalwareReportAI PDF analysis pipeline. It is not a real malware sample and contains no executable malware.

Threat Classification

The simulated incident describes an information-stealing malware family focused primarily on browser credentials, saved passwords, cookies, application credentials, and data exfiltration.

Observed Technical Evidence

Indicator / Behaviour	Observed Evidence
SHA256	8f2a91c7d4e6b305aa12f8c9347de5017b6a2d9e4f083c51d6e7a9b2c4f5a801
File Path	C:\Users\Public\credential_sync.exe
File Path	C:\Users\Public\browser_update.dll
Browser Credential Theft	The simulated stealer searches browser credential stores for saved usernames and passwords.
Cookie / Session Theft	The simulated stealer collects browser cookies and session information for account access.
Application Credential Theft	The simulated stealer searches local application credential databases.
Password Database Access	The simulated stealer reads locally stored password records from supported applications.
Data Collection	Collected account and credential information is prepared for exfiltration.
C2 Communication	The collected information is transmitted to a simulated command-and-control endpoint.
Payload Download	The simulated loader downloads an additional component after initial execution.
Process Creation	The simulated loader creates a child process during execution.

Analyst Notes

The evidence is intentionally focused on information-stealer characteristics rather than keylogging or LSASS-memory access. A malware-analysis system should extract the hash and file paths and identify browser credential theft, cookie/session theft, application credential theft, password database access, C2 communication, payload download, and process creation. The expected broad malware family for this synthetic test is **Infostealer**.

Safety note: This is a non-executable synthetic test document. It contains no real malware and should only be used to test the PDF analysis pipeline.
