

MalwareReportAI – Synthetic Ransomware Test Report

Purpose: This document is a synthetic cybersecurity test report created specifically to test the PDF analysis pipeline. It is not a real malware sample and contains no executable malware.

Threat Classification

The simulated incident describes a ransomware infection. The reported behavior includes file encryption, ransom-note creation, deletion of Windows shadow copies, PowerShell execution, and suspicious executable activity.

Observed Technical Evidence

Indicator / Behaviour	Observed Evidence
SHA256	08207409e1d789aea68419b04354184490ce46339be071c6c185c75ab9d08cba
File Path	C:\Users\Public\akira.exe
File Path	C:\Windows\Temp\payload.dll
PowerShell	powershell.exe -Command "Get-WmiObject Win32_Shadowcopy Remove-WmiObject"
Shadow Copy Deletion	The ransomware deletes Windows shadow copies before encryption.
File Encryption	The ransomware encrypts user files using a hybrid encryption process.
Ransom Demand	A ransom note named akira_readme.txt instructs the victim to contact the attacker.
C2 / Negotiation	The ransom note contains a remote negotiation-site address.
Process Creation	The encryptor creates a child process during execution.

Analyst Notes

The evidence above is intentionally written to contain strong ransomware-related signals. A malware-analysis system should extract the hash, file paths and other indicators, and should identify behaviours such as PowerShell activity, file encryption, shadow-copy deletion and ransom demand. The expected broad malware family for this synthetic test is **Ransomware**.

Safety note: This is a non-executable synthetic test document. Do not download or execute real malware samples merely for testing.
